

HANDLING AND CLEANING OF KOSKIDECOR ECO TRANSPARENT

Handling instructions

Panels are coated with thermosetting materials, but the surface is sensitive to scratching. Protect the panels during machining.

Cleaning instructions

Chemical resistance of phenol and melamine films are good.

Water and a soft cleaning cloth are normally sufficient for cleaning. Almost all normal household cleaning products or disinfectants are tolerated perfectly well, as long as they are not abrasive or highly alkaline.

Alcohol and formaldehyde is possible to use also but before cleaning, test the agent for suitability on a concealed area first.

The coating has been tested against formaldehyde 37 % in Methanol 24 h with no damage.

Aggressive cleaning agents should be avoided, if this is not possible always test the agent for suitability on a spare piece or small area first.
